

## PERSPECTIVE

# From Imitation to Innovation: Emerging Markets' Technology Journey

June 20, 2019

Chetan Sehgal, CFA  
Senior Managing Director, Director of Portfolio Management,  
Franklin Templeton Emerging Markets Equity

Andrew Ness, ASIP  
Portfolio Manager  
Franklin Templeton Emerging Markets Equity

Many investors have a view of emerging markets that remains stuck in the past, and that's particularly true in the realm of technology. No longer simply copying advances made in the developed world, emerging market companies are now leading the way with growing research and development budgets and eye-catching innovations. Franklin Emerging Market Equity Group's Chetan Sehgal and Andrew Ness offer their thoughts on this developing trend.

As we travel around the world meeting business leaders and investors, we've cemented our view that emerging markets equity today is a very different asset class from when we started our careers some 25 years ago.

There are few better illustrations of that evolution than the central role innovation and the use of technology now play in emerging markets. But it's clear from our research that understanding of the potential opportunity in these areas continues to elude many investors.

We see a huge amount of innovation and proprietary knowledge coming through from emerging markets.

While many investors expect emerging markets to follow the development path of more advanced markets, in reality we are witnessing companies seize the lead in innovation and leapfrog the more advanced economies in areas such as e-commerce, digital payments, mobile banking and electric vehicles. Innovative companies are turning previous structural weaknesses into strengths.

Unhindered by sunk investments in legacy systems or infrastructure, they have ample room to come up with forward-thinking and profitable solutions.

The most high-profile example is China, where companies have developed from a replication and simulation approach to leading with their own proprietary research and development (R&D) spend to differentiate themselves from Western products.

A new generation of affluent and savvy Chinese consumers, faced with a lack of retail stores and malls, began turning to their smartphones to purchase goods online. Today, e-commerce makes up a far higher percentage of retail sales in China than in the United States.

A similar trajectory can be seen in digital payments, where the slow development of credit card systems has prompted a consumer migration to online payment platforms such as Alibaba's Alipay and Tencent's WeChat Pay.

Alipay, for example, had a total third-party payment market share of 50% in December 2018 (total payment volume), while WeChat Pay also held a 35% share—with the latter expected to reach 40% market share by the end of 2019.<sup>1</sup> Digital payments have now become commonplace across China, and the value of its digital payment market is multiple times that of the United States.

# Made in China: Outdated Stereotypes of Emerging Market Exports Remain

Despite emerging market product advancements in many areas, a recent survey carried out on behalf of Franklin Templeton's Emerging Market Equity Group suggested UK investors remain hesitant about the value and quality of some emerging markets exports, with many holding outdated stereotypes of products and services "Made in China."

More than half of investors surveyed considered Chinese exports to be "cheap" (53%), with some also describing them as "poorly regulated" (38%) and "low quality" (29%).<sup>2</sup> By comparison, most respondents described UK exports as "well-regulated" (62%) and "reliable" (57%), whilst Japanese products were considered to be both "high quality" (58%) and "innovative" (52%).<sup>3</sup>

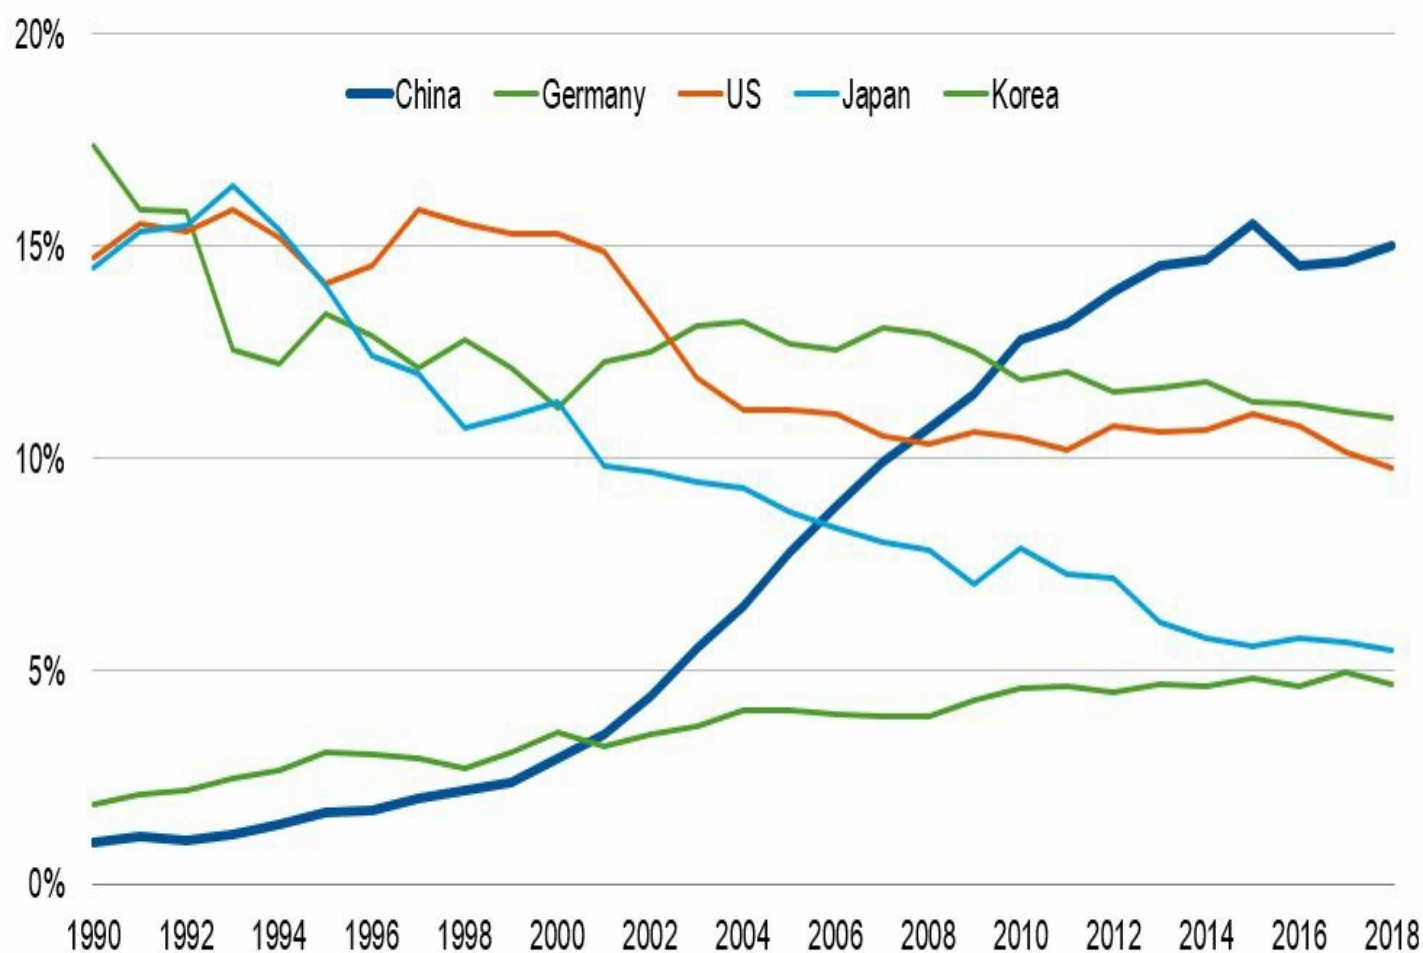

Where once emerging markets economies achieved initial success as producers of cheap home appliances or electronic parts, for example, many of these economies have now set their sights further up the value chain. Indeed, with China and South Korea as leading examples, emerging markets' share of global high value-add exports has risen dramatically since the start of the 21st century, rendering this impression of survey participants out of step with reality.

# China: Trade

## Moving up the Value Chain

### Percent of World High Value-Add Exports

1990—2018

Sources: Intracen; Morgan Stanley, as of May 2018. High Value Exports includes electrical machinery and equipment and parts thereof, sound recorders and reproducers, television, machinery, mechanical appliances, nuclear reactors, boilers; parts thereof, optical, photographic, cinematographic, measuring, checking, precision, medical or surgical, plastics and articles thereof, vehicles other than railway or tramway rolling stock, and parts and accessories thereof, aircraft, spacecraft and parts thereof. Indexes are unmanaged, and one cannot invest directly in an index.

Of course, progress is uneven across emerging markets and we should not downplay the challenges that certain countries still face in their development. This is where we believe on-the-ground research and an active investment approach become critical.

We think some of the most disruptive innovations have hailed from emerging economies, and we expect them to continue to leap ahead in an increasing number of areas. Certain companies have shown exceptional agility in solving consumers' problems, and those that can continue to do so are likely to enjoy sustainable earnings growth.

## **What Are the Risks?**

**All investments involve risks, including the possible loss of principal.** Investments in foreign securities involve special risks including currency fluctuations, economic instability and political developments. Investments in emerging markets, of which frontier markets are a subset, involve heightened risks related to the same factors, in addition to those associated with these markets' smaller size, lesser liquidity and lack of established legal, political, business and social frameworks to support securities markets. Because these frameworks are typically even less developed in frontier markets, as well as various factors including the increased potential for extreme price volatility, illiquidity, trade barriers and exchange controls, the risks associated with emerging markets are magnified in frontier markets. Stock prices fluctuate, sometimes rapidly and dramatically, due to factors affecting individual companies, particular industries or sectors, or general market conditions.
